SHOAL · MOBILE · CURRENT-PUSHED SAWTOOTH

The hardest profile to shrink

This is **2d's** exact data on a phone. A dense sawtooth is the real test of a mobile profile — so the rule is unchanged: **smoothing only rounds corners, never resamples**. The whole dive fits the width so you read its shape at a glance; pinch to zoom for per-sample detail.

WHAT CHANGES ON MOBILE

1

The **readout** reflows from one row into a 3×2 grid in the app's own stat-band idiom (22 px numerals, mono labels, hairline dividers).

2

SAC and **peak-ascent** are **surfaced** — the two figures the current mobile band hides — because the profile now supplies them, both in the red they earn.

3

Annotations go terse — “FAST ASCENT · 11 M/MIN” becomes “↑ 11 M/MIN” — and temperature keeps its right-hand °C axis.

4

Gas gets its own strip under the grid — a full-width tank gauge, the one row that reads better wide than boxed.

The **Smoothing**, **Curve weight** and **Temperature** tweaks drive this screen too — set Smoothing to 0 to watch the raw polyline appear on the phone.

SHOAL · DIVE FILE INTEGRATION

Does the profile replace the headline stats?

Short answer: **yes** — **when the dive has a profile**. The floating stat band was always a compromise: it repeated numbers the diver couldn't see, and half its cells sat empty (— AVG, — SAC) because those need a profile and a tank pressure the band never had. Put the numbers **on the chart** and every cell fills in with context: max depth sits on its trough, temperature on its axis, SAC beside the gas it was computed from.

Visibility is the one exception — it's a *condition*, not something the profile measures — so it moves down to the Conditions card where it belongs. See the recommended layout **3a**, and the keep-a-slim-band alternative **3b**.

The chart **is** the stat surface. Every headline number now sits next to the shape that produced it — and the empty cells are gone because the profile supplies AVG and SAC directly. Visibility relocates to Conditions (highlighted), the only headline stat the profile doesn't measure.

20 m
VISIBILITY

DEPTH PROFILE

18.4 m
AVG DEPTH

28 °C
MIN TEMP

11.0 L/min
SAC · GOOD

210 → 50 bar

Keeps a familiar three-cell band for the numbers a diver glances at before opening the profile — and these three are **always present**, even on a hand-logged dive with no computer trace, so the band never shows a gap. The profile then owns everything derived. The cost: max depth and duration appear twice.

SHOAL · DESIGN STUDY V2 · DEPTH · TEMP · GAS

Reading a dive at a glance

The water column hangs from the surface: fill lives **between the surface line and the depth curve**, so blue reads as a body of water. Every card now leads with a **readout strip** — big tabular figures in the app's own numerals, including SAC, which the app already computes and colours (green good, taupe moderate, red high).

Temperature is no longer a floating squiggle — it's a proper **second line read on a right-hand °C axis (2b)**. Smoothing is corner-rounding only; judge the design by the ugly data: **2b** and **2d**.

LEGEND

Water column, hung from the surface line

Depth curve — tinted by NDL headroom: quiet blue with time to spare, warming to red at zero

Temperature — read on the right °C axis

Fast-ascent warning — the only annotation still coloured

Events: entry/exit · max depth · gas switch

EVENTS · ON

GAS · SAC · ON

Tweaks: Smoothing (0 = raw polyline), Curve weight, Temperature axis on/off.

2a

CASE 01 · BASELINE

Clean recreational dive

19.7 m
MAX DEPTH

41 min
DURATION

15.8 m
AVG DEPTH

21 °C
MIN TEMP

15.8 L/min
SAC · GOOD

210 → 70 bar

The baseline: descent, an unhurried bottom, a staged ascent. The readout carries the whole story in numbers — and SAC of 15.8 L/min reads green, an efficient, relaxed dive.

2b

CASE 02 · OBLIGATION

Decompression dive

32.7 m
MAX DEPTH

44 min
DURATION

20.5 m
AVG DEPTH

17 °C
MIN TEMP

14.0 L/min
SAC · GOOD

232 → 74 bar

NDL is woven into the curve itself — while there's plenty of no-stop time the line stays **quiet, a soft echo of the water's blue**, lighter than the water fill so it barely reads as a border at all. As the limit nears it **warms**, then hands straight off to **danger red** the instant it hits zero. Every curve in this set now carries the same tint — most dives simply never leave the blue. The deco stops are the consequence here — obvious from their flat steps, so no stop anywhere needs a colour of its own. Temperature reads on the right °C axis.

2c

CASE 03 · INTENT

Multi-level dive

30.3 m
MAX DEPTH

55 min
DURATION

17.0 m
AVG DEPTH

11.0 L/min
SAC · GOOD

210 → 75 bar

Three deliberate levels step back toward the surface. This dive recorded no temperature — the trace and its right axis simply never render, and the frame closes up cleanly.

2d

CASE 04 · HONESTY

Current-pushed sawtooth

15.3 m
MAX DEPTH

40 min
DURATION

10.7 m
AVG DEPTH

15 °C
MIN TEMP

25.8 L/min
SAC · HIGH

220 → 40 bar

Surge rendered honestly: smoothing only rounds corners — the yo-yo texture (itself a decompression-risk signal) survives, and one sustained rise past 9 m/min earns a coral flag, the last annotation still coloured. The curve itself stays mostly cool here — this dive's risk was gas, not NDL: **SAC of 25.8 L/min** reads red, fighting current burns gas. Set **Smoothing** to 0 for the raw polyline.

2e

CASE 05 · RANGE

Layout stress — 8 m × 12 min beside 40 m × 75 min

5A · SHORT & SHALLOW

7.9 m
MAX DEPTH

12 min
DURATION

5.2 m
AVG DEPTH

13.2 L/min
SAC · GOOD

58 · LONG & DEEP

40.4 m
MAX DEPTH

75 min
DURATION

20.8 m
AVG DEPTH

19 °C
MIN TEMP

11.5 L/min
SAC · GOOD

The same frame at both extremes: axes derive from the data, so an 8-metre reef potter and a 40-metre wall dive keep identical grammar — readout strip, temperature axis (present on the deep one, absent on the shallow), SAC — without either looking stretched.
